Programming with Arrays

Generic Programming with Arrays

Dilemma of Array Programming

❖ Classical Approach (FORTRAN, C)

☐ low abstraction level → large and complicated programs

☐ high runtime performance

❖ Generic Approach (APL)

☐ high abstraction level → small and concise programs

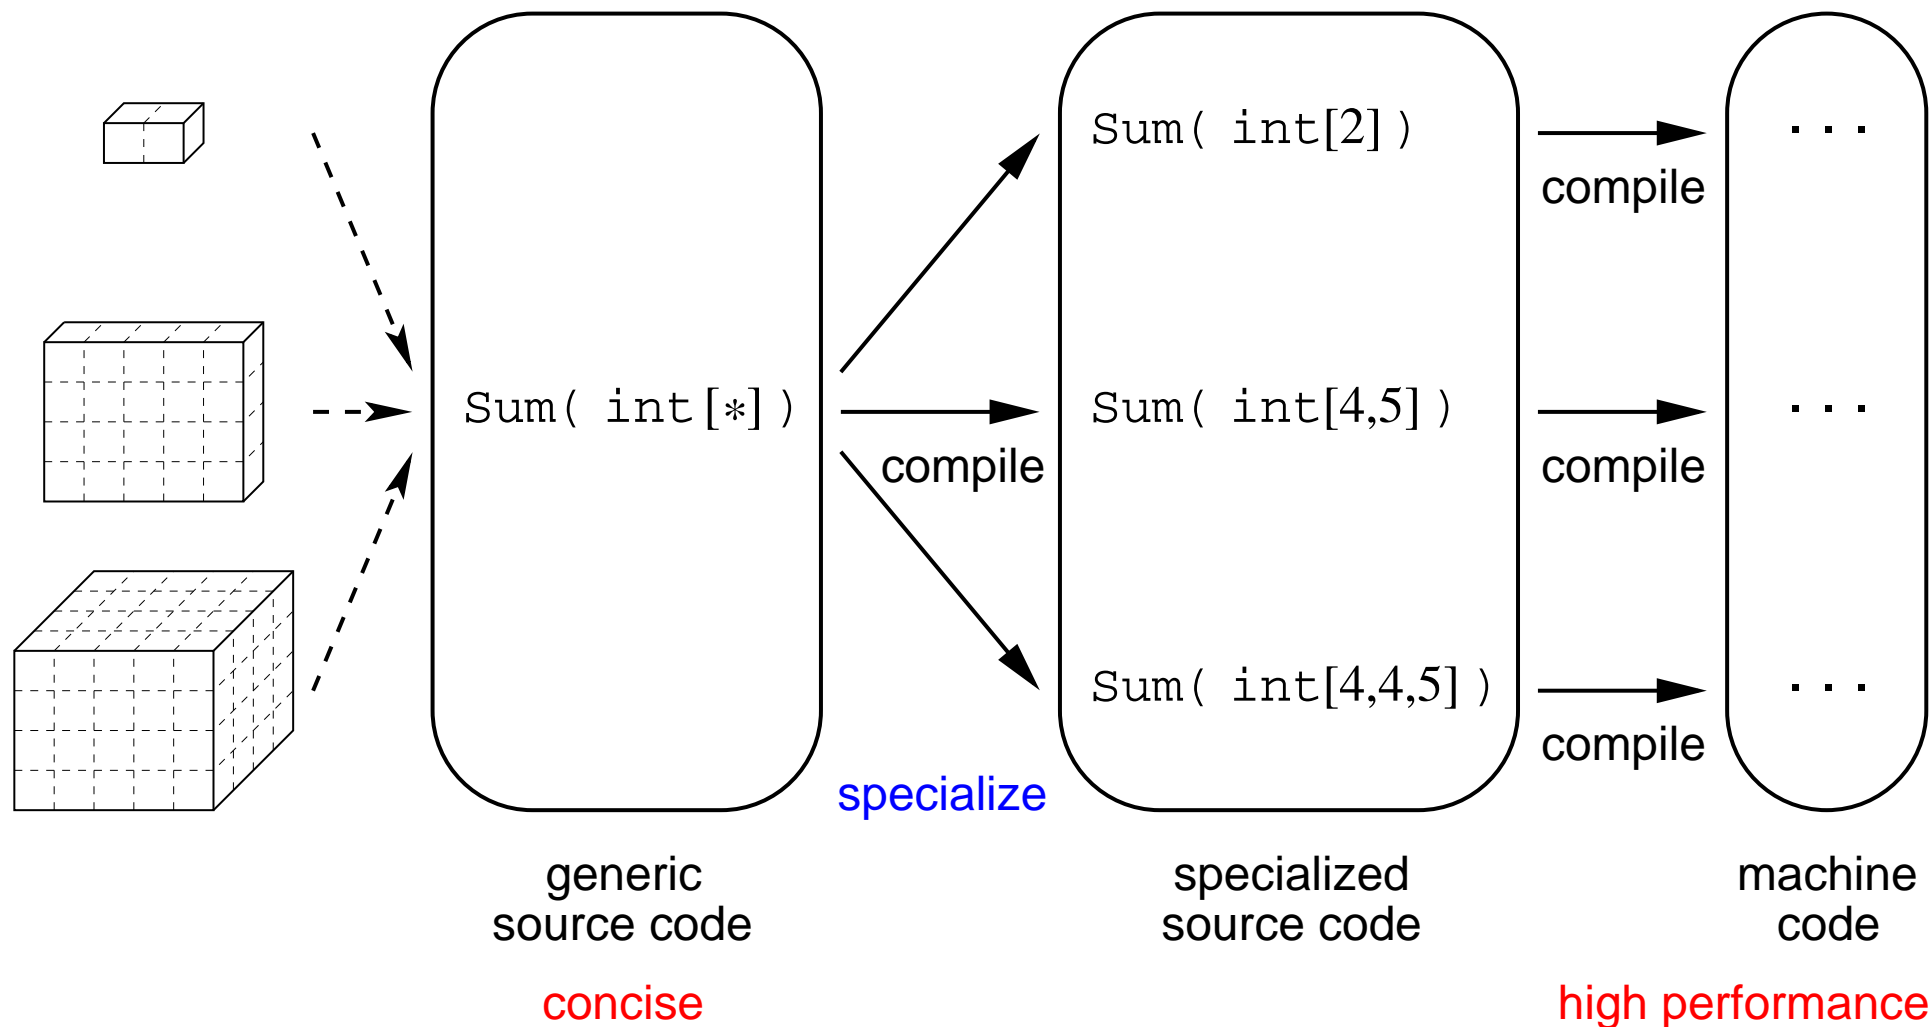

☐ low runtime performance

Neither of these approaches is satisfactory

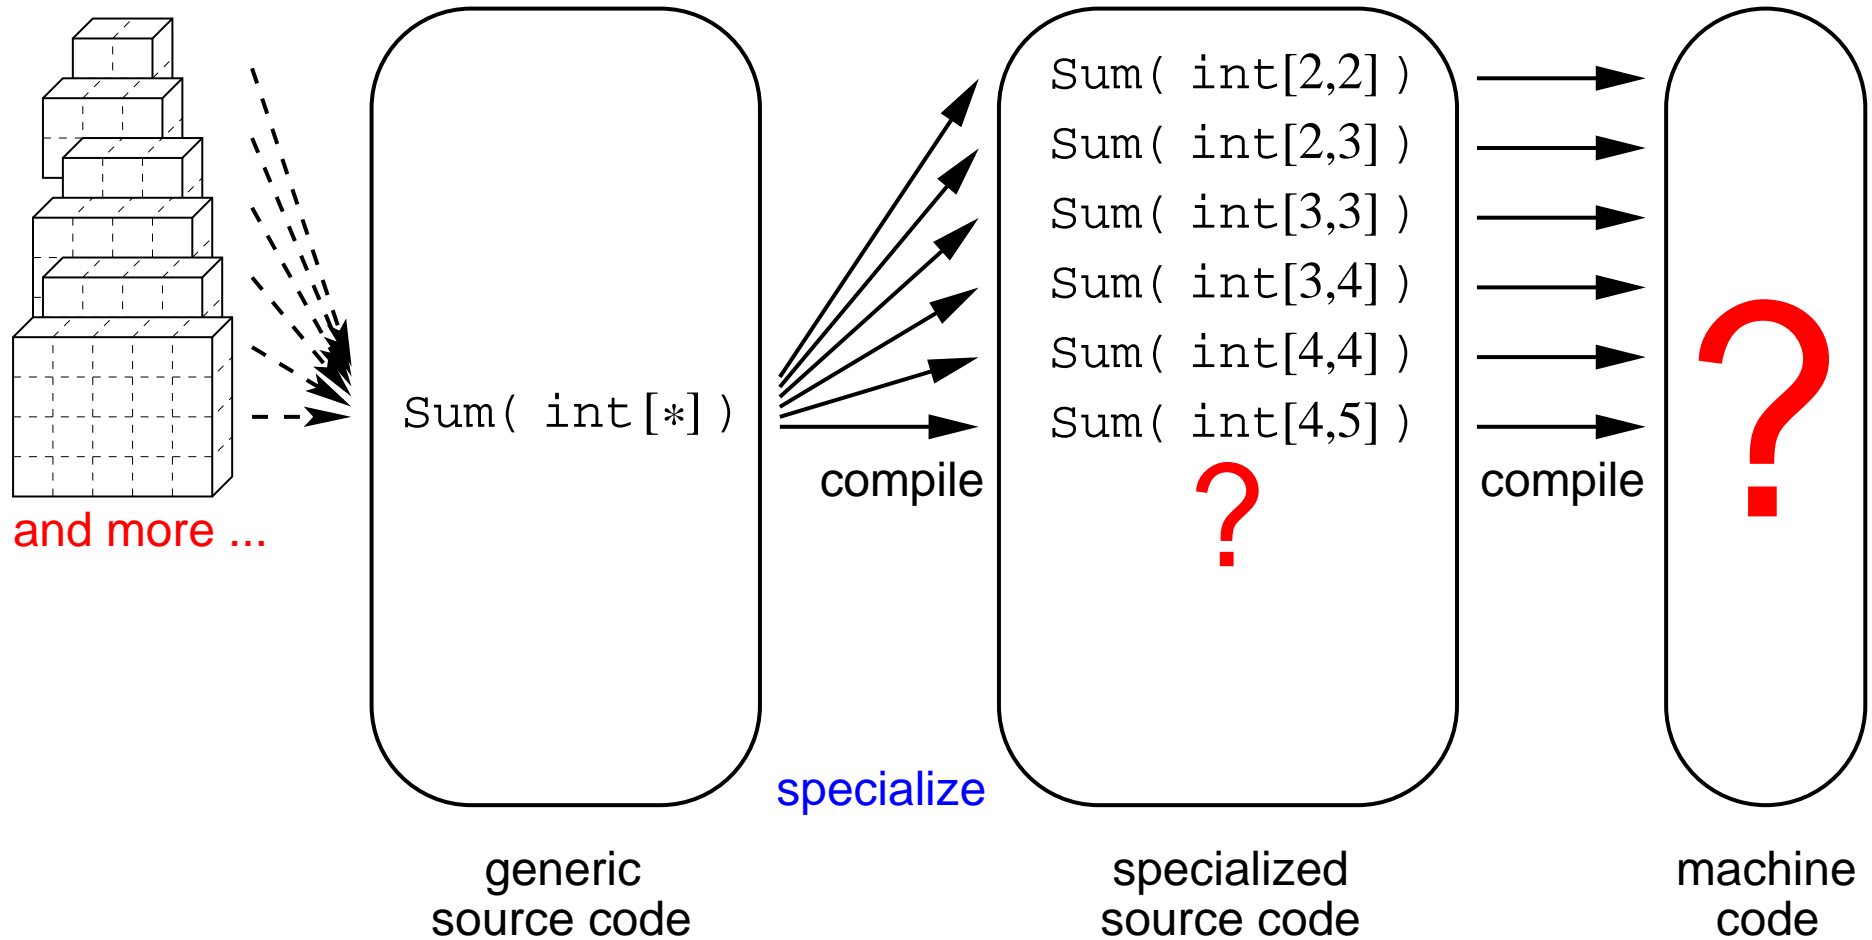

⇒ Can advantages of both be combined?

The SAC Approach

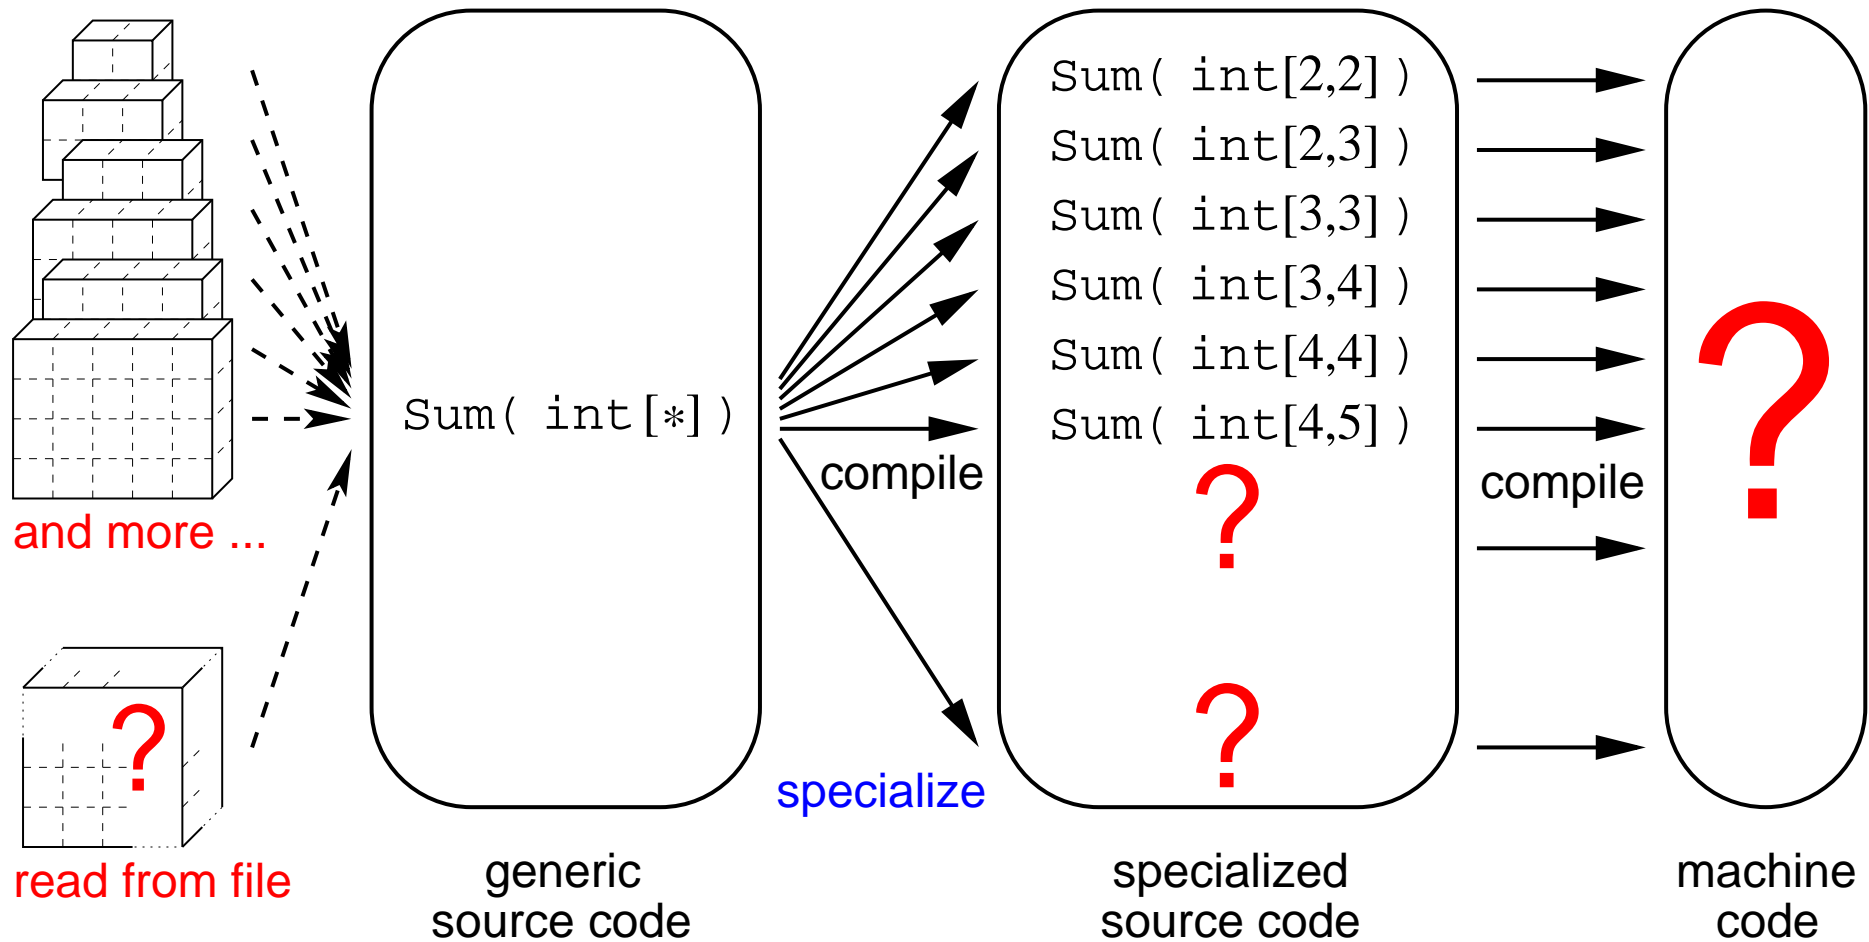

SAC: Functional array programming language based on C syntax

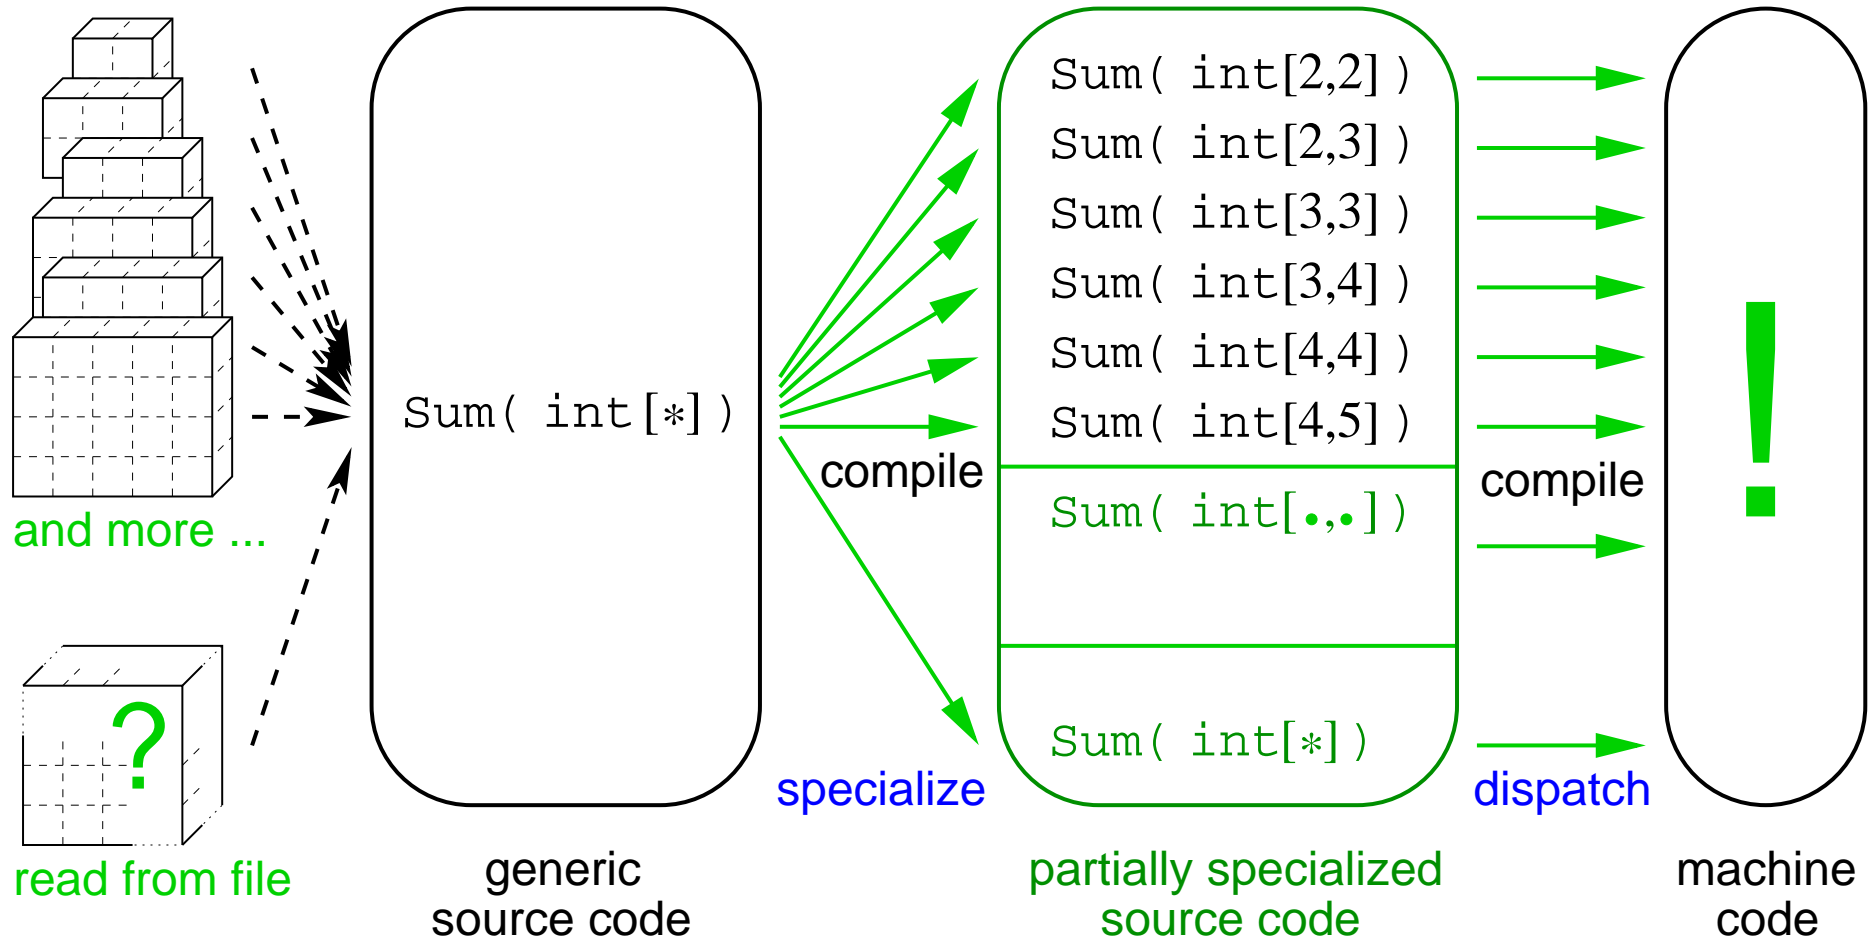

Limits of the SAC Approach

Limits of the SAC Approach

New SAC Approach

Example: Determinant of a 2-dimensional Array

$$\det \begin{pmatrix} a & b \\ c & d \end{pmatrix} = ad - bc$$

```
Det( int[2,2] A)
{
    ...
}
```

Laplace expansion along the first column:

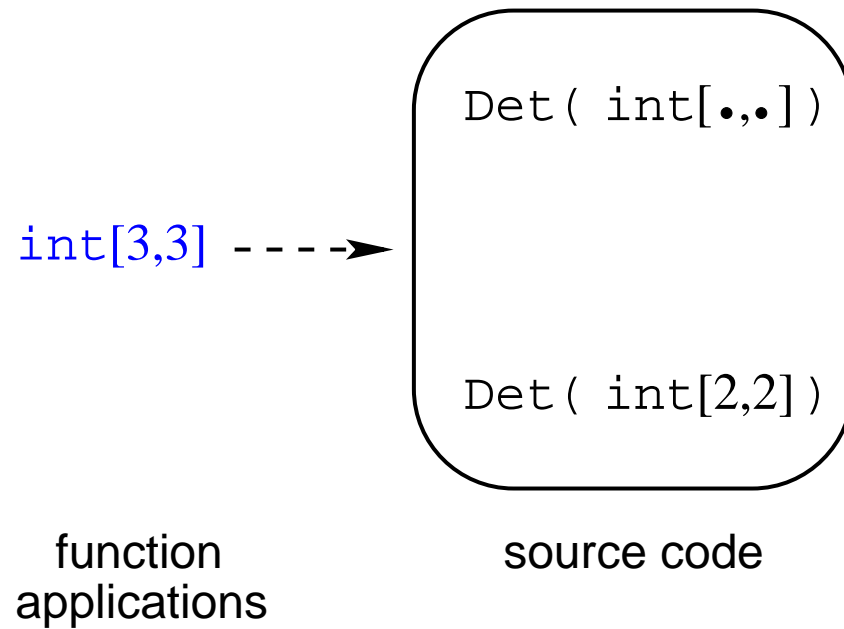

$$\det(A) = \sum_{i=0}^{n-1} (-1)^i \cdot A_{i0} \cdot \det(\mathcal{A}_{i0})$$

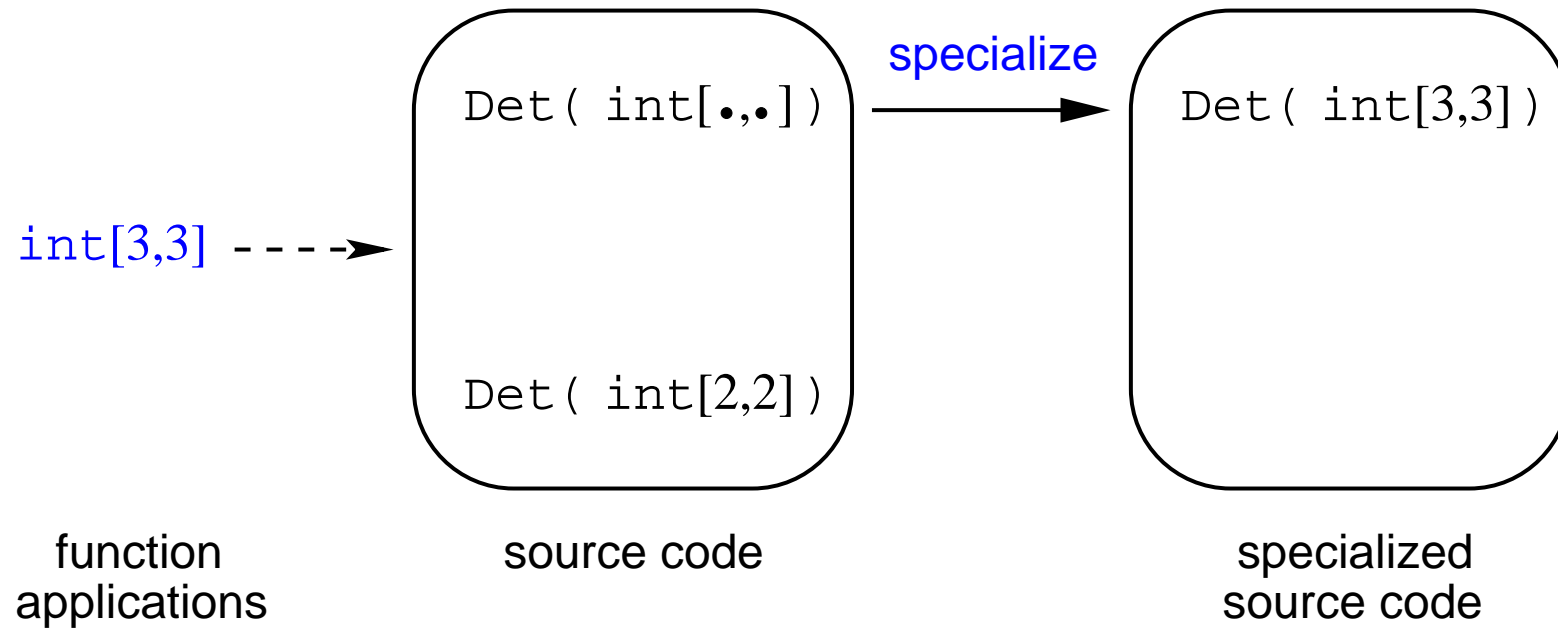

```
Det( int[.,.] A)
{
     $\mathcal{A}_{i0} = \dots A \dots i$ 
    ... Det(  $\mathcal{A}_{i0}$  ) ...
}
```

Function Overloading

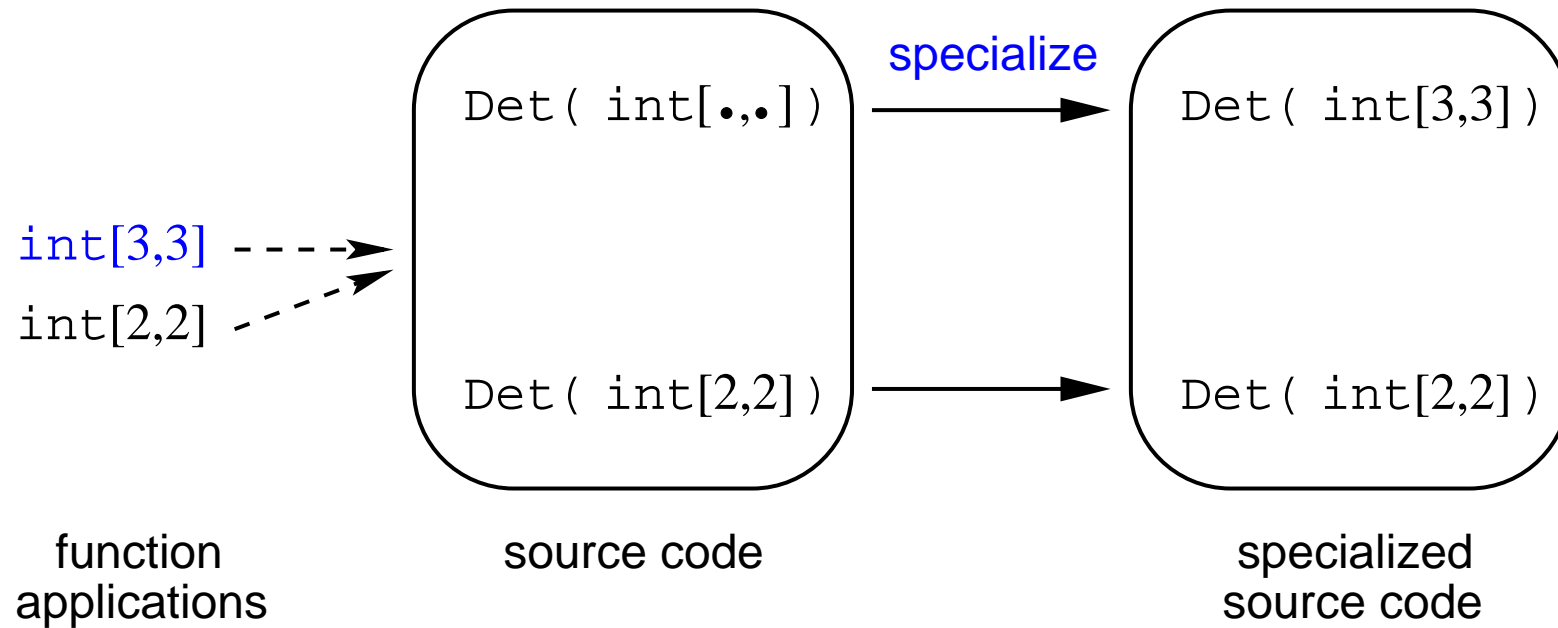

Function Specialization

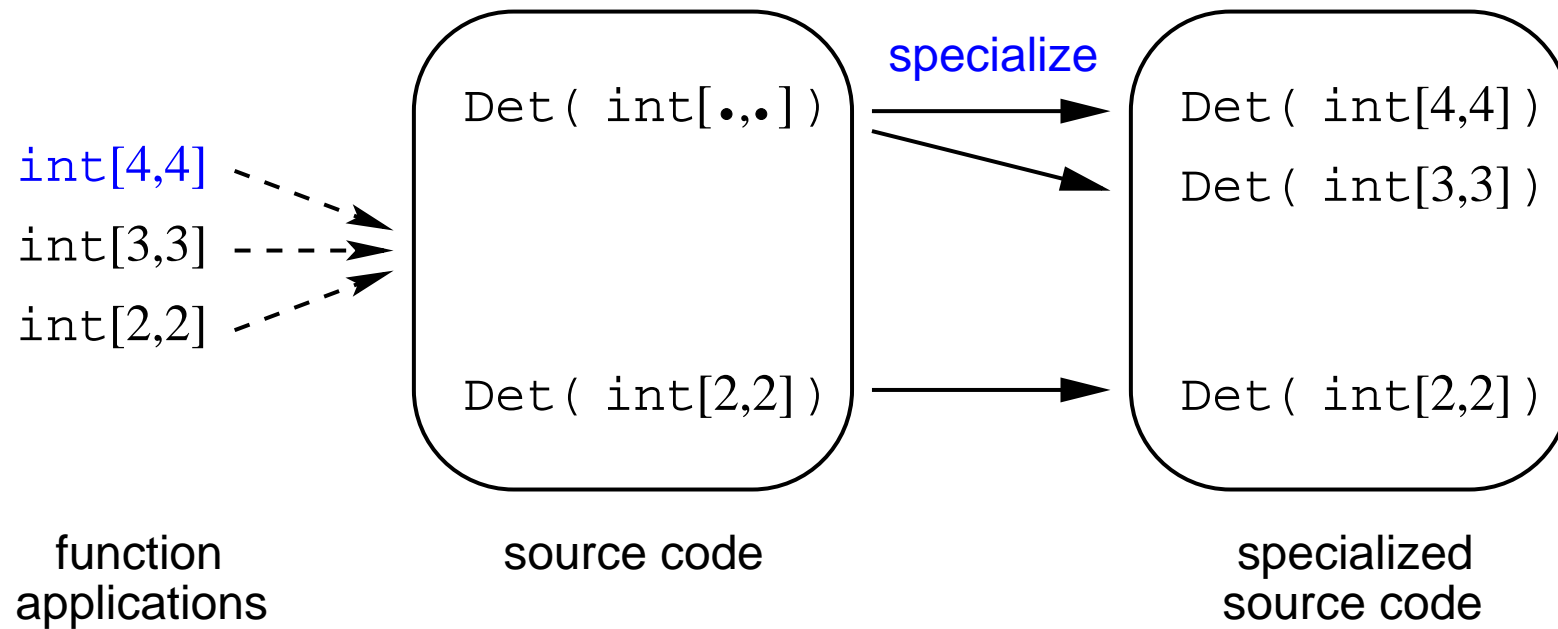

Function Specialization

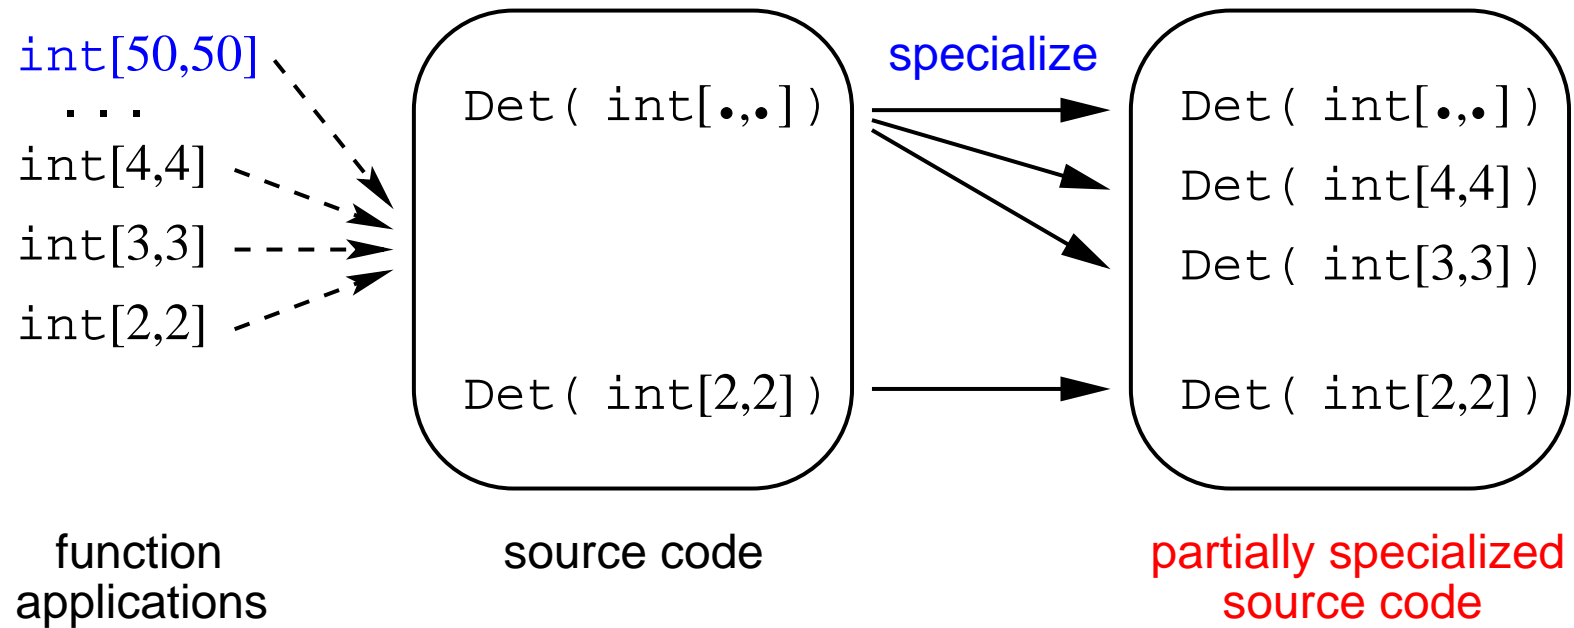

Function Specialization

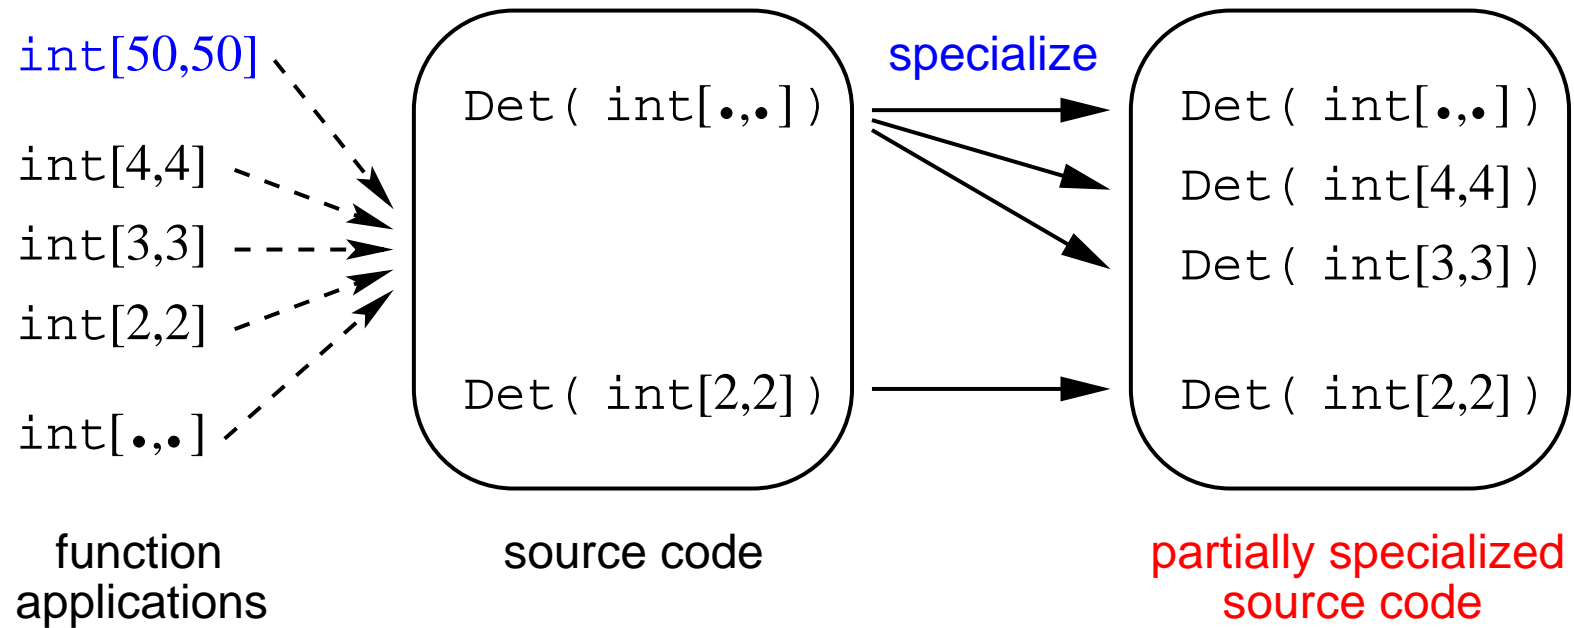

Function Specialization

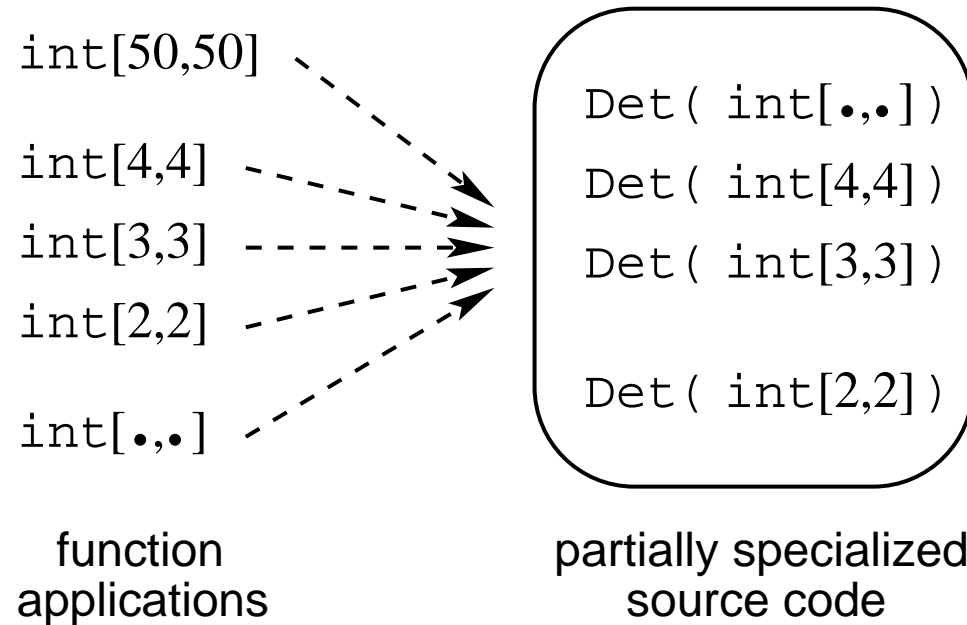

Function Specialization

Function Specialization

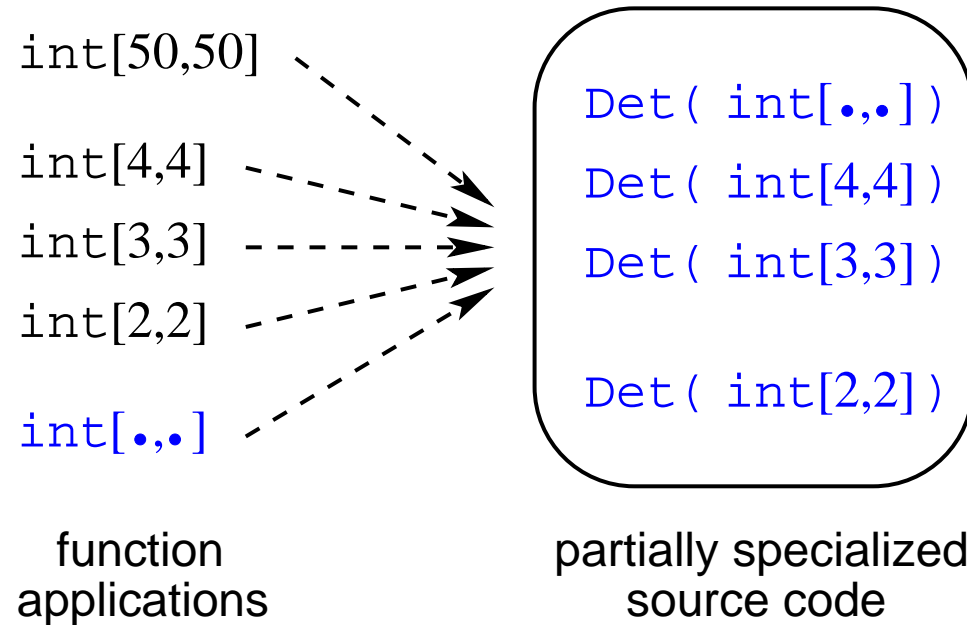

Dispatch of Function Applications

Shape-specific argument → **Static dispatch**

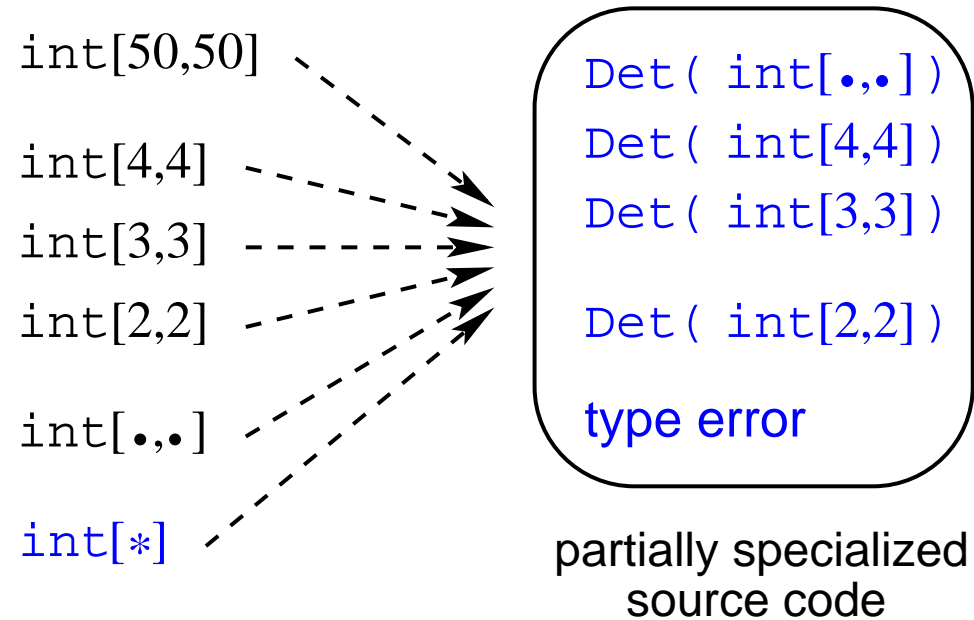

Dispatch of Function Applications

Non-shape-specific argument → **Dynamic dispatch**

- ❖ **Necessary** for **overloaded versions** to get correct results
- ❖ **Recommended** for **specialized versions** to get utmost runtime performance

Dispatch of Function Applications

Non-shape-specific argument → **Dynamic dispatch**

- ❖ **Necessary** for **overloaded versions** to get correct results
- ❖ **Recommended** for **specialized versions** to get utmost runtime performance

Hybrid Dispatch: Intended Results

`int[50,50]` --> `Det(int[.,.])`

`int[4,4]` ----> `Det(int[4,4])`

`int[3,3]` ----> `Det(int[3,3])`

`int[2,2]` ----> `Det(int[2,2])`

static dispatch

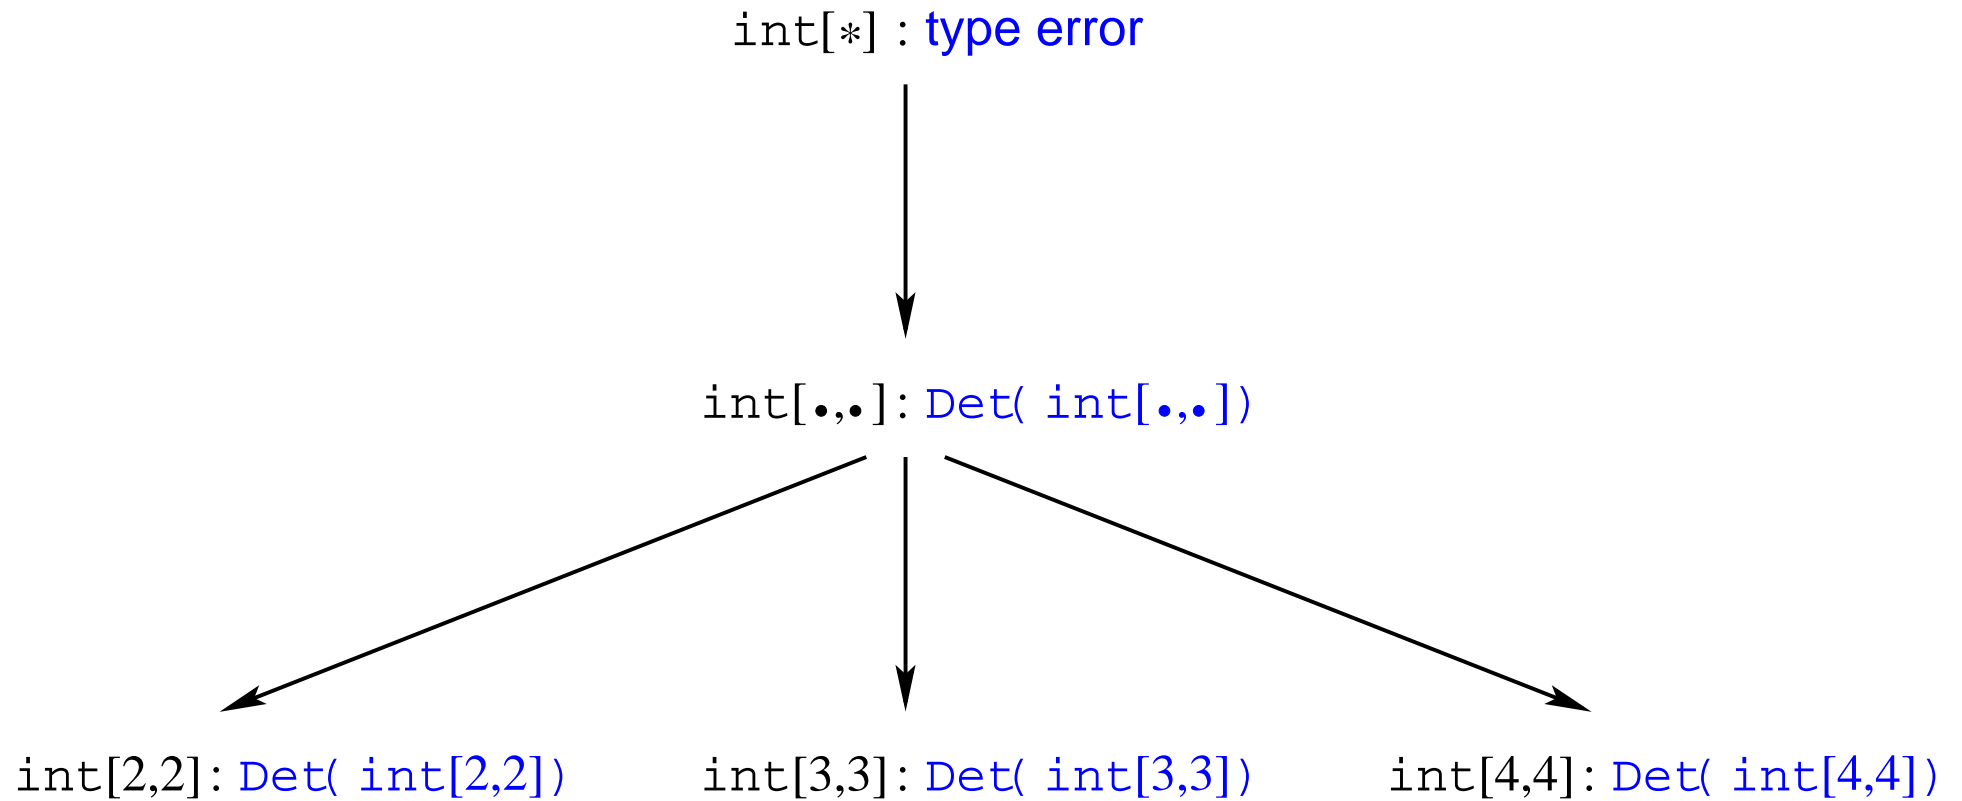

`int[.,.]` ----> `Det(int[.,.])`
`Det(int[4,4])`
`Det(int[3,3])`
`Det(int[2,2])`

`int[*]` ----> `Det(int[.,.])`
`Det(int[4,4])`
`Det(int[3,3])`
`Det(int[2,2])`
`type error`

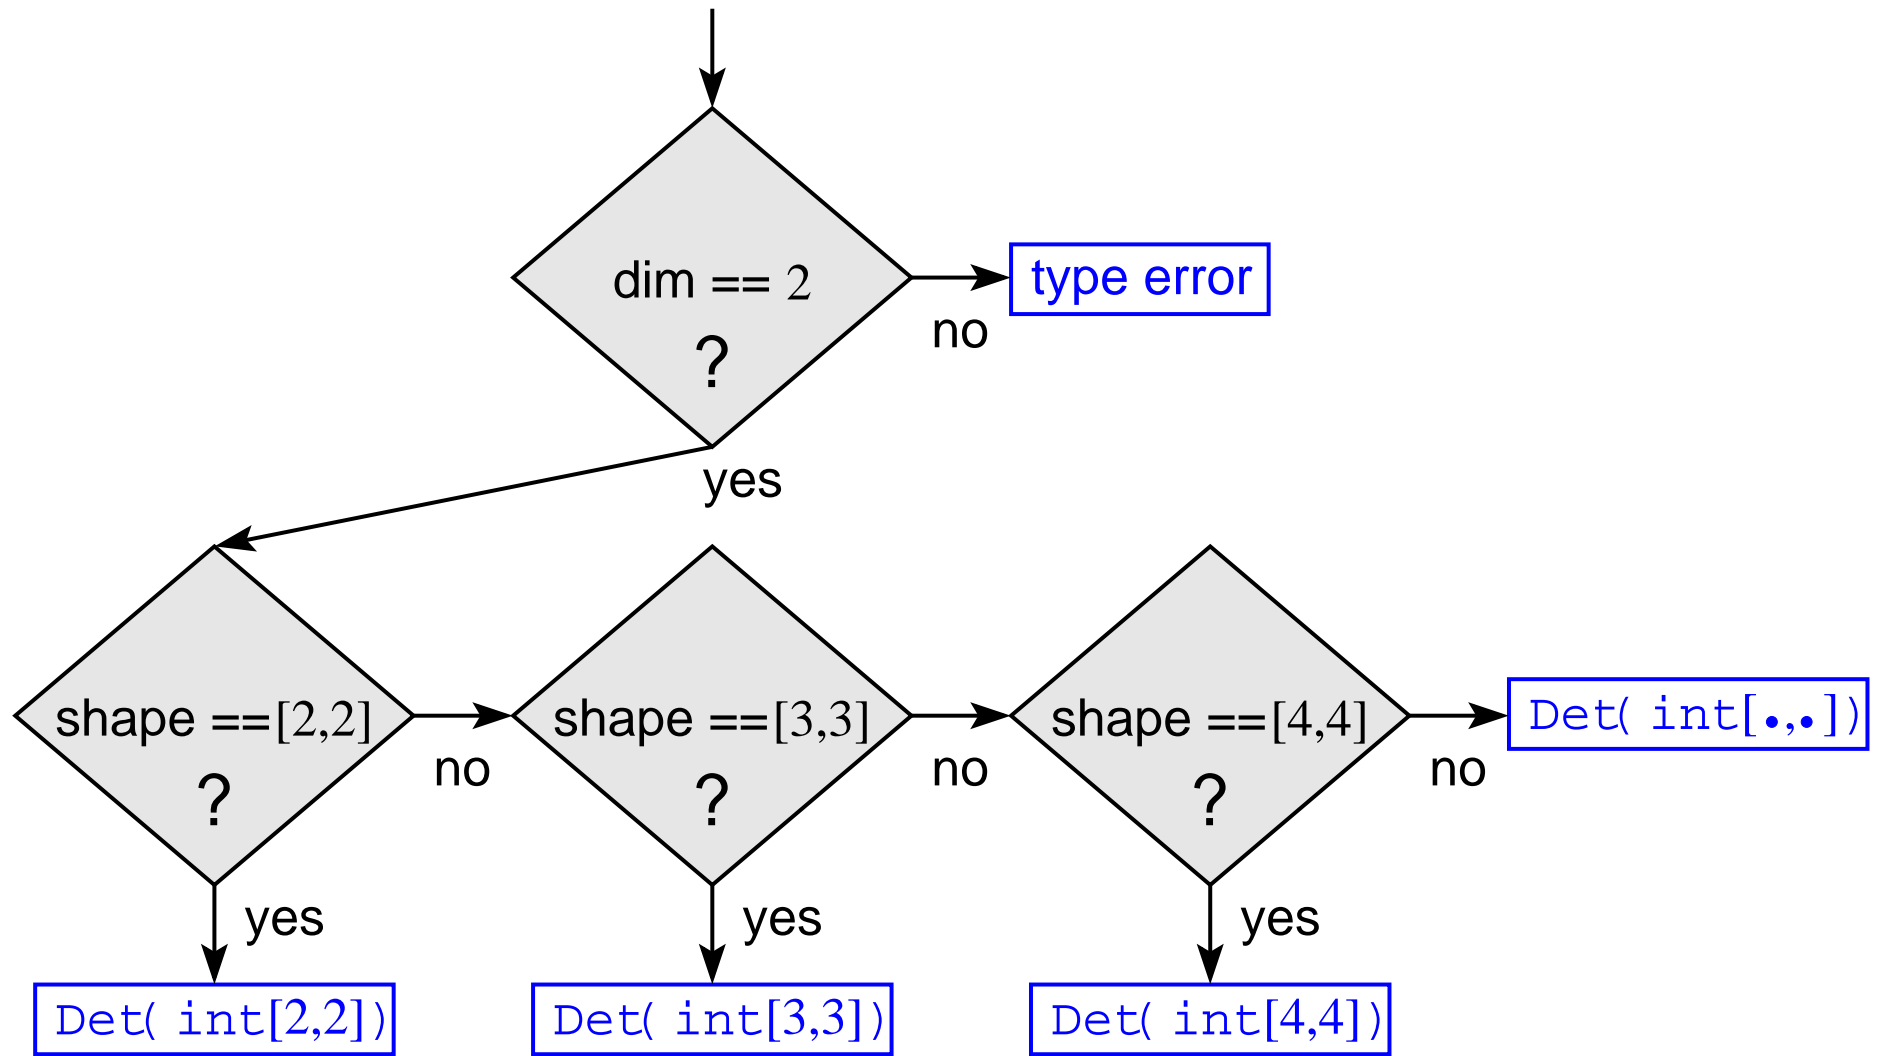

dynamic dispatch

⇒ **Hybrid dispatch:** As static as possible, but as dynamic as necessary

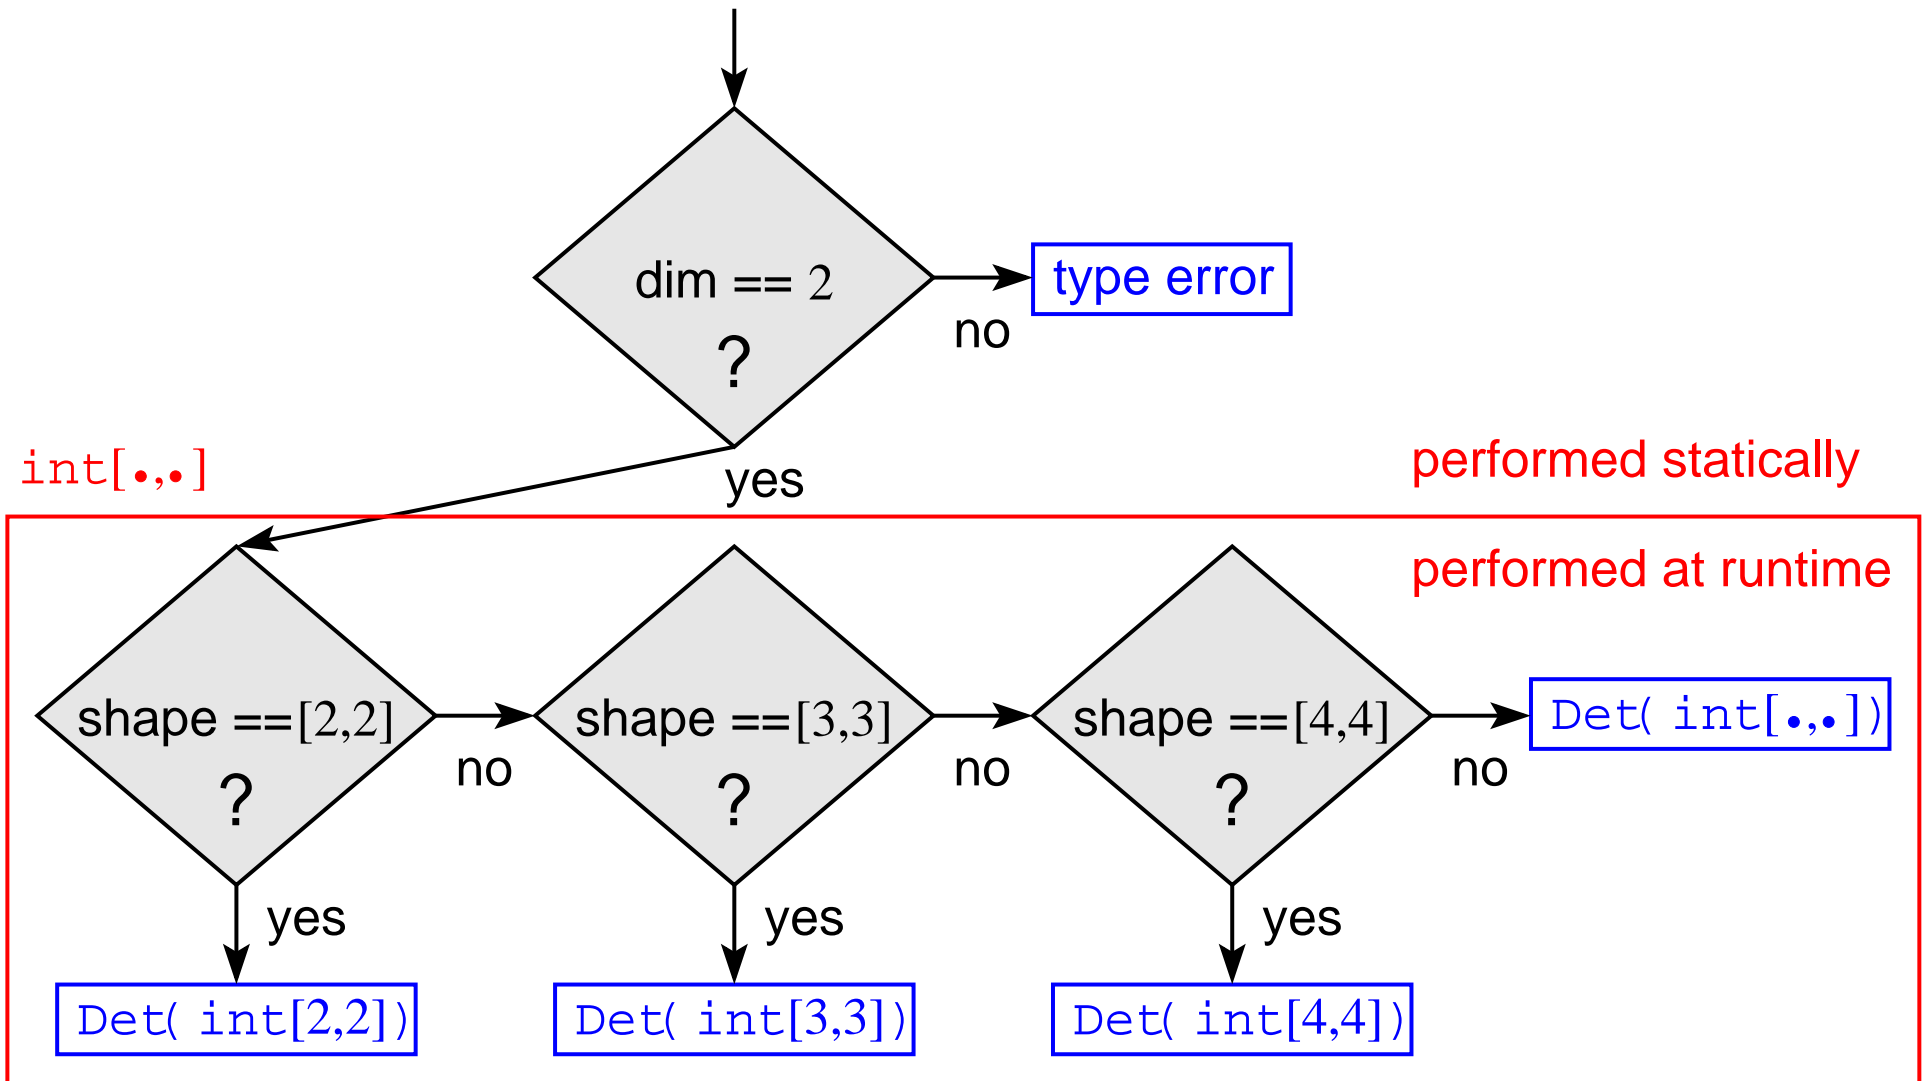

Hybrid Dispatch: Decision Tree

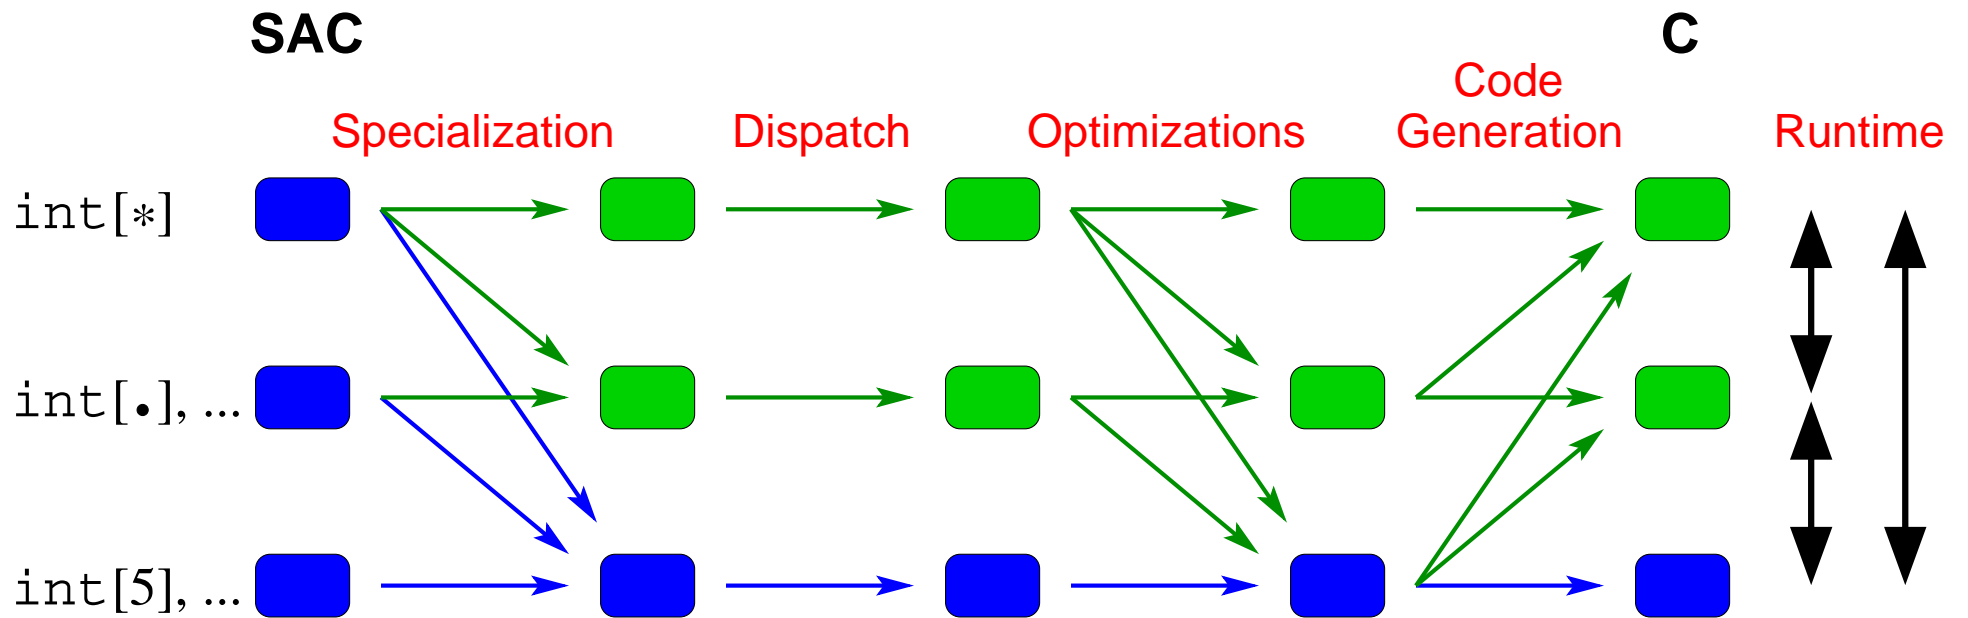

Hybrid Dispatch: Algorithm

Hybrid Dispatch: Algorithm

The Compilation Process

Runtime Performance: Determinant of a 10×10 Array

Conclusions and Future Work

Conclusions:

Dilemma has been solved:

Generic programming and high runtime performance

- ❖ Preserves excellent runtimes of fully specialized code
- ❖ Avoids code explosion due to unlimited specialization
- ❖ Allows generic input data
- ❖ Allows separate compilation (library functions)

Future Work:

- ❖ Better specialization strategy
- ❖ More optimizations on non-shape-specific arrays
